FOR RELEASE

BUREAU OF AGRICULTURAL ECONOMICS UNITED STATES DEPARTMENT OF AGRICULTURE

CS-121

JAN.-FEB.-MAR. 1948

Approved by the Outlook and Situation Board, March 18, 1948

SUMMARY

By mid-March cotton prices had recovered 2.5 of the 3 cent decline that occurred in the first half of February. Middling 15/16" on March 13 averaged 34.29 cents per pound in the ten spot markets compared with the low of 31.42 a month earlier. Premiums for the staple lengths longer than 15/16" of Middling and better grades continued to widen as did discounts on most grades and staple lengths shorter than Middling 15/16". Farm prices of cotton in mid-February averaged 30.71, nearly 2.5 cents per pound below that of January 15. The decline in the farm price of cotton reflected not only the general decline in commodity prices but also the lower quality of the cotton marketed.

Mill consumption in February was 785,000 bales of cotton compared with 860,000 in January and 839,000 in February 1947. If the August-February rate were continued for the last five months of the season, total consumption for 1947-48 would be 9,300,000 bales compared with 10,025,000 bales last season. It is probable, however, that the current rate will be lower later this season.

Exports of cotton for the August-January period were low, totaling only 872,000 running bales of which 357,000 were to Japan. Exports probably will not increase substantially over the current rate until legislative action is taken on programs for economic aid to Europe.

The U. S. Department of Agriculture in testimony presented before the United States Tariff Commission opposed any increase in the present import quota of cotton of 1-1/8" and longer. The Department presented data indicating that current supplies are sufficient to meet requirements for these cottons during the remainder of the season.

Price of Cotton Declines

Spot prices of cotton declined over 3 cents per pound in the first half of February but then increased gradually and by mid-March were within 1/2 cent of the prices at the beginning of the period. Middling 15/16" in the ten designated markets averaged 34.61 cents per pound on February 2, 31.42 on February 13, 33.86 on March 2 and 34.29 on March 13. Although fluctuations during the period were irregular, losses amounting to more than 1 cent occurred only on two days, February 10 and March 8, while gains amounting to almost 1 cent occurred on March 2.

Premiums for grades above Middling 15/16" on February 26 averaged only one point less in the ten spot markets than on January 29. Premiums for the medium staple lengths (above 15/16" through 1-1/16") of Middling grade were moderately wider. In Memphis, premiums for Middling 1-1/8" increased 150 points to 1,275. Discounts on Middling and better grades shorter than 15/16" staple length widened as did those on practically all lengths of spotted and tinged cotton, while those on Strict Good Ordinary and Good Ordinary narrowed somewhat.

Farm prices of cotton in mid-February averaged 30.71 cents per pound, nearly 2.5 cents below the January 15 average. The decline in price probably reflects the lower quality of cotton marketed as well as the break in commodity prices in the first part of February. The parity price of cotton declined 37 points to 30.75 cents after increasing for seven successive months. This was the first time the average farm price of cotton has been as low as the parity price since August 1945.

Mill Consumption Remains High

Domestic mills consumed 785,000 bales of cotton during February, compared with 860,000 in January and 839,000 in February a year ago.

Average consumption of 39,927 bales per working day in February was only 82 bales less than January and was larger than for any other month since April 1947. In February 1947, daily consumption averaged 41,969 bales. Consumption per active spindle during February was 17.9 pounds, compared with 19.7 for January and 18.7 in February 1947. Active cotton system spindles were operated at 137.6 percent of capacity (80 hours per week=100) compared with 139.0 percent for January and 130.8 percent in February last year.

Total consumption during the first seven months of the 1947-48 season was 5,423,000 bales, down 10 percent from the corresponding period last year. During the last 20 years, 58.2 percent of the average annual consumption occurred in August-February. During this time, consumption for the first seven months ranged from 53.0 percent to 63.2 percent of the annual total. Last year, the proportion was 60.4 percent. If the pattern of mill use this year should equal the average of the last 20 years, total consumption for this season would be about 9,300,000 bales. There are several indications, however, that the current high level of consumption may not continue during the remainder of the season. Among these are decreasing exports of textiles,

.. To e/ ".

declining prices for textiles at wholesale levels, and increasing inventories of textiled at wholesale and retail levels. In view of these indications, it is expected that mill consumption for the 1947-48 season will probably total about 9 million bales. (**ejiding**)

Cotton Exports Continue Low

In January 1948, 214,000 bales of raw cotton were exported. This brought the total for August-January to 872,000 bales, less than half as much as for the same period last year. During the war years 1940-44 when exports averaged only 1,417,000 bales, exports for August-January were 686,000 bales, nearly 80 percent as much as the total for the first six months this season.

Japan received 357,000 bales, or 41 percent of total August-January exports while the 16 countries participating in the European Recovery Program received only 323,000 bales or 37 percent. In 1935-39, total exports for the first six months of the year averaged 3,526,000 bales, but only 19 percent went to Japan while 55 percent was exported to the 16 European countries.

Compiled from reports of the Bureau of the Census.

Stocks of cotton in importing countries have been substantially reduced in recent months. Therefore, exports of cotton probably will be increased over the current rate regardless of the amount of economic assistance that is made available to European countries. The extent of the increase in exports, however, will depend in large measure on the volume of financial assistance made available. The European Recovery Program as proposed to Congress calls for exports to the European nations affected, amounting to 780,000 bales in April-June of this fiscal year and about 2.5 million bales in each of the next four years.

Imports of raw cotton from all sources and from United States into 16 participating countries in European Recovery Program, 1925-1946 with proposed imports 1948-49 to 1951-1952

1/ Preliminary.

Compiled from reports of the Department of Commerce.

Principal factors contributing to the current low rate are:

- l. The lack of dollar exchange or credits. These countries are making every effort to use available dollar exchange or credits only to purchase high priority commodities that cannot be secured except in the United States. They have been procuring raw cotton either by barter or from those countries in which currency other than dollars is acceptable.
- 2. The rélatively large stocks of cotton with which most of these countries started the season. In 1945 and 1946 most of the countries were able to replenish their stocks of cotton to about prewar levels and started the current season with more than a half year's requirement at 1946-47 rates of consumption. No doubt there has been a tendency in some instances to make these stocks last until some decision is reached on the programs for economic aid to Europe.

Fertilizer Sales Decrease

5 percent in Southern States of inti-sent

Tag sales for fertilizer from July 1947 through January 1948 in the 11 Southern States totaled 3,584,000 tons compared with 3,756,000 for the same period last year. Six States, led by Alabama and Arkansas showed decreases from last years sales while five States led by Oklahoma and Texas showed increases over 1947.

U.S.D.A OPPOSES INCREASE OF IMPORT QUOTAS FOR LONG STAPLE COTTON

A hearing was conducted on February 17, 1948, before the United States Tariff Commission "to determine whether the circumstances requiring the import quotas on cotton having a staple of 1-1/8" or more in length continue to exist, or whether changed circumstances require the modification of the quotas for the present quota year or for future quota years." Witnesses included representatives from Cotton Importers Textile Manufacturers, Cotton Producers, Cotton Merchants and Department of Agriculture.

The U.S.D.A., in reviewing the history of import quotas for cotton, states that in 1938 and 1939 the price support program for cotton had caused prices in the domestic markets to rise enough above those in foreign markets that imports of foreign cotton into the United States had become a serious threat to the United States agricultural program. This resulted in the adoption of import quotas under the authority of the Augricultural Adjustment Act of 1935, to restrict imports of foreign cotton into this country. The USDA concluded its testimony as follows:

"Furthermore, since the supply of both American and Egyptian cotton 1-1/8" and longer is adequate to meet mill requirements through September and leave a comfortable working reserve, and since the new quota year begins September 20 and since the domestic crop becomes available to mills by early October, stocks of cotton are adequate. Therefore, no increase in the quota is recommended."

1/ Preliminary and partially estimated.

Compiled from reports from the Cotton Branch, Production and Marketing Administration.

COTTON TEXTILE PRODUCTION IN JAPAN

According to the November report of the Supreme Commander for the Allied Powers, Japanese production of cotton cloth has increased from an annual rate of about 370 million square yards in August-October 1946 to the current annual rate of 675 million square yards. This rate is probably comparable to that of around 1920, before the expansion of cotton textiles production took place in Japan.

Prior to 1920, Japan was not a major producer of cotton textiles. In the early 1920's however, she began to expand her cotton textile industry and by the mid-1930's the number of installed spindles averaged about 11 million. As early as 1929, Japan was second only to the United States in the consumption of raw cotton. Peak production of cloth was reached during 1934-37 when the average annual output was b billion running yards of various widths. Slightly over half of the cloth was of coarse yarns with the remainder mostly of medium yarns.

Japanese exports of cotton textiles increased rapidly and by 1933 she had become the world's leading exporter of cotton cloth. The peak was reached in 1934-37 when exports averaged 2.8 billion square yards annually. The exact proportion of cotton cloth production that was exported is not known since available data show production in running yards and exports in square yards. In 1929, Ching India and the Netherlands Indies took 73 percent of all Japanese cotton cloth exports and continued to be the major importers through 1937. However, exports to Latin America increased and by 1938 about 20 percent were going to these countries.

After 1931, the number of trade barriers against Japanese cotton cloth exports increased. Some of them were: the French quota system of 1932, the Ottawa Agreements of 1932, the import quotas of the Netherlands Indies and the British Crown colonies, the agreements between Japan and the United States limiting sales of cloth in the Philippine Islands. Together with the weak exchange position of the yen, these restrictions helped bring about the decline in Japanese cloth exports that started after 1937.

During the peak production years, 1934-37, annual imports of cotton into Japan averaged 3,783,000 bales. Of this, 1,550,000 bales or 41 percent were from the United States. By 1939, however, total imports of cotton had declined to 2,793,000 bales of which only 795,000 bales or 28 percent were American grown.

Post-War Situation. During World War II, a large part of the cotton textile mill machinery and equipment in Japan was scrapped to produce military equipment and ammunition. The International Textile Mission to Japan after the war reported that only about one-fifth of the prewar mill capacity remained in February 1946. The number of installed cotton spindles was estimated at 2,2 million of which one-half were operable. The Supreme Commander for the Alied Powers reported that as of October 1, 1947, the number of installed spindles had been increased to 2.9 million with 2.8 million operable and 1.5 million actually in operation. Japan's ability to increase her operable spindles so fast was due to the fact that a substantial part of the capacity for producing textile machinery remained intact after the war. This capacity was used in 1946 mainly to repair damaged spindles and looms, and in 1947 to produce new spindles and looms.

Table 1.- Imports of raw cotton from all sources in 16 countries participating in European Recovery Program,
1925-46

piled from official sources except as noted.

Bales of 500 lbs. gross weight or 478 pounds net.

Average for 4 years only.

International Yearbook of Agricultural Statistics.

The reovery of Japanese textile mills will depend in large measure on decisions of the occupying powers with respect to textile manufacturing machinery in connection with problems of reparation and the removal of Japan's war potential. Some actions already taken, however, indicate that occupying authorities are facilitating recovery of the textile industry on an export basis. As of December 30, 1,222,000 running bales had been exported to Japan from the United States. For the most part this was short staple, low grade cotton supplied by the Commodity Credit Corporation under an agreement with the War Department and U.S. Commercial Company (a subsidiary of Reconstruction Finance Company). Payment by Japan was to be made by delivery of 60 percent of the manufactured product for sale to other Asiatic countries and the remainder to be consumed in Japan.
